GRASS GIS is the main program for geographic information system tools in the free distribution. It is a universal GIS, suitable for both professionals and home users. GRASS is based on a Geographic Information System, in which you can use GRASS modules and various tools to perform various processing operations. GRASS GIS includes a database of over 18.000 land features, including: OpenStreetMap data for high-resolution maps. FOSS GIS shapefiles (of different geometries) for over 150 countries of the world. CAD data and government data from over 20 countries, including national data for over 300 cities in the world. It also includes over 21.000 global/regional DEMs and TERs. GRASS GIS is a comprehensive tool that offers a large amount of functions, from vector data analysis, map creation, image processing, spatial modeling and data visualization. GRASS GIS can be used with a wide range of formats including shapefiles, comma-separated values (csv), shapeindex and many more. It can be used on Windows, Mac OS and Linux, and is highly customizable, allowing you to install additional modules and enable features you want to use. Its excellent documentation and user forums allow you to learn how to operate GRASS GIS by reading text, watching videos or playing games. Key Features GRASS GIS can be used for: Vector data analysis, including multivariate statistics, trend analysis, and pattern detection Vector data conversion and conversion of vector to raster Vector data registration and merging Vector data creation and editing Raster data analysis, including statistics, raster modeling, raster creation, raster classification and raster overlay Raster data conversion and conversion of raster to vector Raster data registration and merging Raster data creation and editing Vector data preprocessing (including orthorectification and re-projection) Vector data classification and raster data classification Vector data labeling Vector data processing (including editing, clipping, and modifying) Vector data exporting and importing Vector data merging Vector data modeling Vector data vectorization Raster data preprocessing (including orthorectification and re-projection) Raster data classification Raster data labeling Raster data processing (including editing, clipping, and modifying) Raster data exporting and importing Vector data feature display Vector data classification Vector data vectorization Vector data editing Vector data manipulation

The goal of this book is to provide you with the knowledge necessary to perform a wide variety of geospatial data manipulation tasks in a manner that is efficient and effective. A single GRASS GIS user can effectively run this book using a single copy of GRASS GIS 7.4.1. While it is necessary to be familiar with the concepts of basic image processing and raster analysis in order to effectively use GRASS GIS, you are not required to be an expert. In fact, you don't have to have much experience in the field of spatial data analysis to use this book. The book has been written to assume that you have some basic familiarity with the GRASS GIS interface, though as a minimum it is recommended that you be familiar with the fundamental concepts of the command line interface. If you have already used GRASS GIS, but have never worked on large, multi-dimensional projects, or have limited experience in image processing and raster analysis, you will find this book a useful resource. Re: "GeosysIT" is great program, but unfortunately it's very weak in projection support GeosysIT is great program, but unfortunately it's very weak in projection support. Mostly it supports the UTM projection system. And the only information about the WGS84 projection is an undefined field in a record. I found the references to WGS84 on the website. Unfortunately, the UTM is used as default. Any comment?
