That's probably enough for a positive overview of Lightroom 5, so that we can move on to the cons. I can surely talk about some of the other new additions here, but most of those are the usual "Since they are there, why not try them out?" sort of features. I will focus my attention on the cons that are somewhat more serious, while as we will see later, the pros vastly outweigh those. The first thing I do in Lightroom 5 is import previously edited images. You can easily perform Smart Objects editing in Lightroom 4, and the newly introduced Smart Objects in Lightroom 5 do not disappoint. They are a great way to create a new layer and edit something on it. While you can use a Mask to conceal parts of the image later on, the Smart Objects version lets you quickly add selections that remain editable later on. As soon as you open the image in the app, you can use the smart-selection tools to select the area (or parts of the area) of the image you wish to edit. For example, if we were to select the dog's head in the above image, we can make any changes in the dog's fur.

Now let's hide the dog's face. Even after 6 years -- after being converted from using stuck-in-photoshop-5, as it was called -- it seems to me that Photoshop remains fairly content with its own abilities. Nevertheless, there are ways to make the process of working in Lightroom a little bit more intuitive, since the software is a common denominator for both the desktop and mobile applications. The newly earned Advanced Develop option enables you to correct bad lens or camera profiles. You can choose an option to actually display the lens and camera profiles (good), but you can also display a Delta E. This gives you the option to test the camera and lens with Adobe Camera Raw's Lens Correction feature. Select a color from an eyedropper tool, then, click each end point of the eyedropper tool, and the corresponding point on the CMYK channel is highlighted. This is one of the capabilities that totally blew me away. It saves me infinite amounts of time over using older, more basic (and less interesting) tools. If your lens or camera is bad, the combination of these two tools should provide some relief. Let's start with the lens profile. First, you will need to open the image and then select the Gray in the Clipboard tool. Click the LAB Channel (the last tool on the list) on Adobe Photoshop; the base of all the color spaces are opened. Next, open the gray layer (similar for Red, Green and Blue). Then, click the color matching eyedropper tool (a magnifying glass in a blue background), and click the gray layer again.
