As you may already know, Fujifilm recently announced the X-Mount line of lenses for its X-Series cameras. One of those cameras is the X-T1, which was announced last month at Canon's EOS press conference. Some of the tools and functions I was testing were problematic and there is still much room for improvement, especially in Apple's new, much more powerful image editing software, like Magic Mouse 2 and Photoshop CC. But even when the software is deliverable, minor and sometimes major problems are always going to arise. In Photoshop, you can always choose the point of view and camera that you are editing in any photo. Unfortunately, after an import you can't double-check if you made that choice before or not. You are always editing in point of view, although you can choose from a few different back view and front view settings. For example, if you take a photo of yourself, you can see how your face and body look like in point of view from the front and back. You can also play around with the Front and Back view and edit any photo. It is a great new feature that makes photo editing a whole lot more fun. I really hope that it will become a standard feature. So far, it is only available in the paid version though. It's my opinion that both Photoshop and Lightroom combinations are a crucial part of any photographer's arsenal. I personally already use Lightroom for organizing my photos and Photoshop for editing them, but until then, the previous versions of these software were my companion when editing photos in a digital darkroom. I had always avoided Apple's glowing iPads since I had already seen a lot of criticism towards the fact that they are not fully compatible with Photoshop I would have been perfectly happy to end this review at this point, but unfortunately the last question brings us on to the downsides of Adobe's rightly popular image management and RAW converter tool. I did say Lightroom emphasizes speed, but perhaps clarifying this statement is in order. The emphasis on speed lies in the flexibility of available tools. For example, you can now do some advanced image "healing" with the updated Spot Removal tool and remove objects that are more complex than simple dots. And that saves you time working with Photoshop on the same image, which I personally appreciate very much. When it comes to the actual speed of operation, however, things haven't really changed for the better. Importing is, if anything, slightly slower. The same with Exporting, which also feels to be more sluggish than before. Use that brilliant Spot Removal tool too many times on too many photographs and you may experience lag when changing adjustments or moving from one image to another. Other obvious bugs and performance issues do not make a very good impression, either. Of course, complex Spot Removal shapes are bound to eat up those resources. After all, there is quite a bit of vectoring involved, not to mention that the image is not actually changed since Lightroom applies changes non-destructively. In essence, any adjustments you perform, including the Spot Removal and the Radial Filter tools, remain as descriptions that must be read by the software. Even so, I believe that a careful optimization of how computer resources are used, as well as some database tweaking should be possible. Or perhaps Adobe needs to start utilizing some in-memory database processing features that we see in enterprise-class databases and applications today. Yes, the speed of modern computers is faster than ever, but with the software getting more and more complex, I feel that Adobe should invest some time in optimizing and tweaking it. It took Adobe a while to add full 64-bit support to Lightroom and I am not sure how well it actually utilizes multi-core CPUs and caching technologies. Probably not enough, considering how slow Lightroom can get.
